

Pile Caps

A pile cap is an essential part of a marina's equipment. It dresses up the docking facility, protects the vulnerable top of the piling from water penetration, and discourages birds from perching or nesting on the piling. The pile cap can be secured to wood pilings by a fastener or nail. An epoxy adhesive should be used on concrete pilings.

Constructed of high gloss, long lasting fiberglass, 1/8" minimum wall thickness, with a layer of gel cote protection for long lasting beauty. Furnished in white color.

ROUND FIBERGLASS PILE CAP
